EXP-6

6. The online cake ordering system allows users to browse a variety of cakes by category, flavor, and occasion, complete with detailed descriptions and images. Users can register, log in, and manage their orders through a personal dashboard. The ordering process includes selecting a cake, customizing options like size and message, entering delivery details, and making secure payments via an integrated payment gateway. Admins can manage cake inventory, track orders, and handle user accounts through an admin panel. Users receive order confirmation emails and can track delivery status. The website is fully responsive, providing a seamless shopping experience on all devices.

Buy a Cake is a portal which allows admin in developing counters to advertise and sell their cakes. This would permit rural communities to make their wares available to the rest of the world. The proposed system is to develop the website for a cake store. Users can buy the nearby cakes available in the app.

Functionalities

- Search cakes by occasion, flavor, size and delivery date.
- View cake listings with description, price per kg and stock status.
- Customize the order with size and a message on the cake.
- Place an order and view it in My Orders with its delivery status.
- Download or print the order history.
- Responsive layout for desktop, tablet and mobile.
- Backend features (login, payment gateway, confirmation emails, admin panel) are to be connected to this frontend.

1. HTML Code

Save the following code as index.html. It includes HTML, CSS, and a small JavaScript search and order interaction. Replace sample records with real data when connecting a backend.
